

# Every Beginning Matters: Fetal Mortality in St. Louis County, 2019-2023

---

Presented to Community Action Team (CAT) Meeting

# Why This Matters

The health of our mothers and babies is a mirror reflecting the health of our entire community. Fetal mortality is more than a statistic; it's a measure of our collective well-being and a call care for every family.

A sensitive topic we will approach with care.

A shared challenge that requires a shared response

A story told through data, leading to action

# Our Approach

## Case Definition

A fetal death is the loss of a pregnancy at 20 weeks of gestation or more.

## Data Source

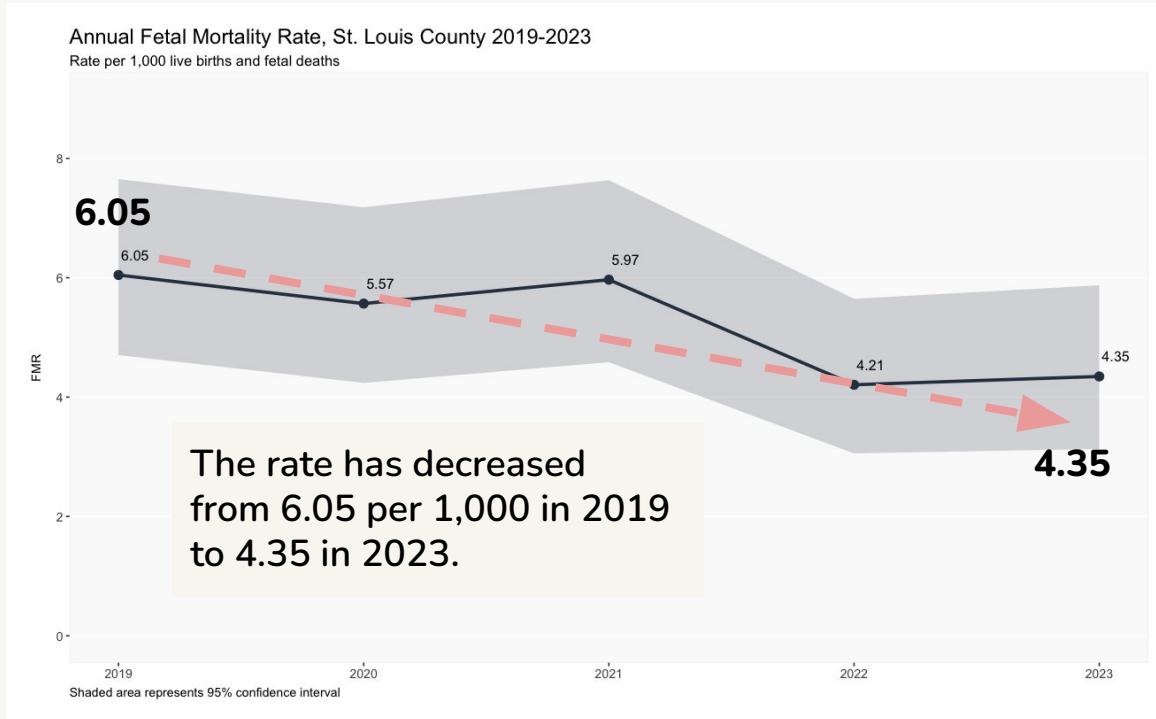

St. Louis County birth and fetal death records from 2019 to 2023

## What is a 95% Confidence Interval?

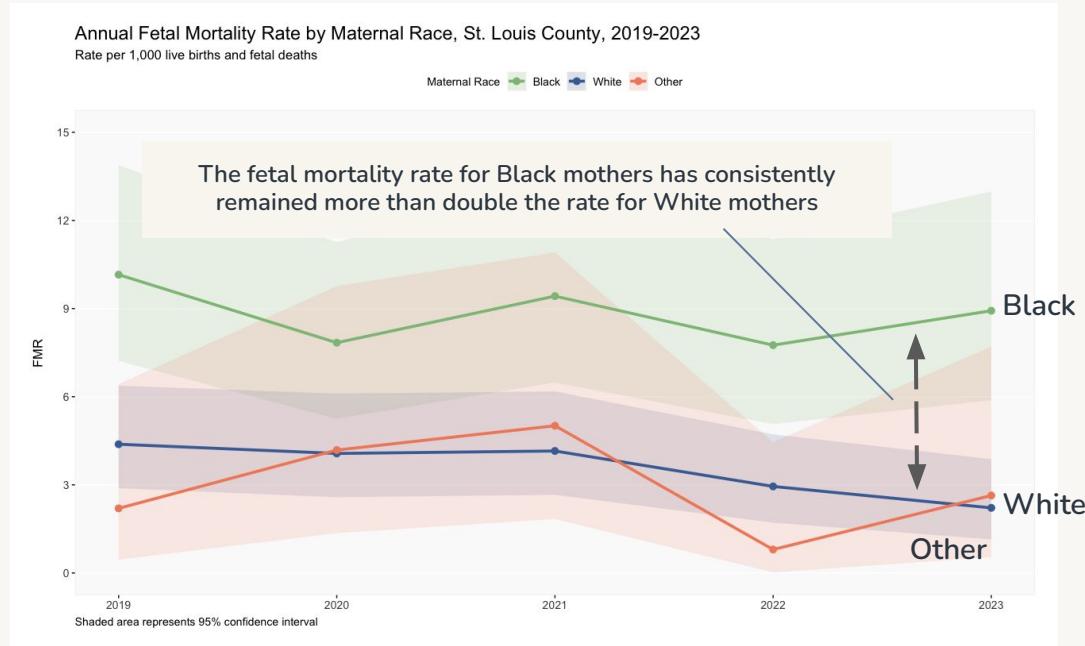

A measure of reliability. The shaded areas on our graphs show the range where we are 95% sure the true rate lies. Wider ranges mean less certainty, usually because of smaller numbers of events.

# The Big Picture: Overall Fetal Death is Trending Downward

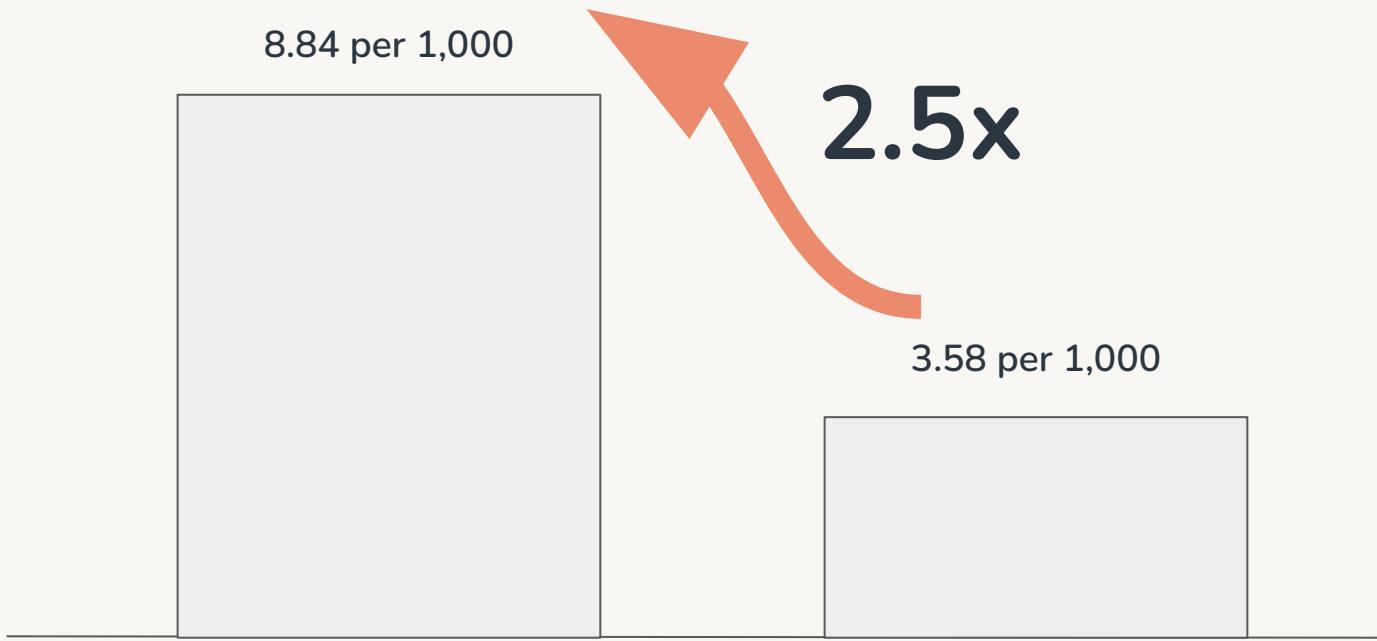

**But... does this overall trend tell the whole story?**

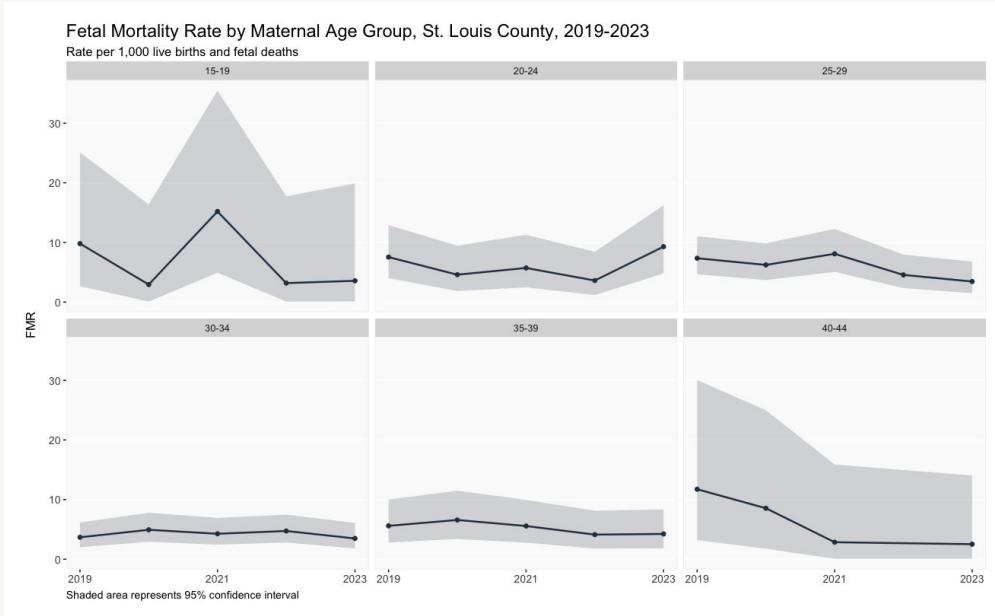

# A tale of Two Realities: A Deep and Persistent Racial Gap

# Black Mothers Face 2.5 Times the Risk of Fetal Loss

# Risk is Highest among the Youngest

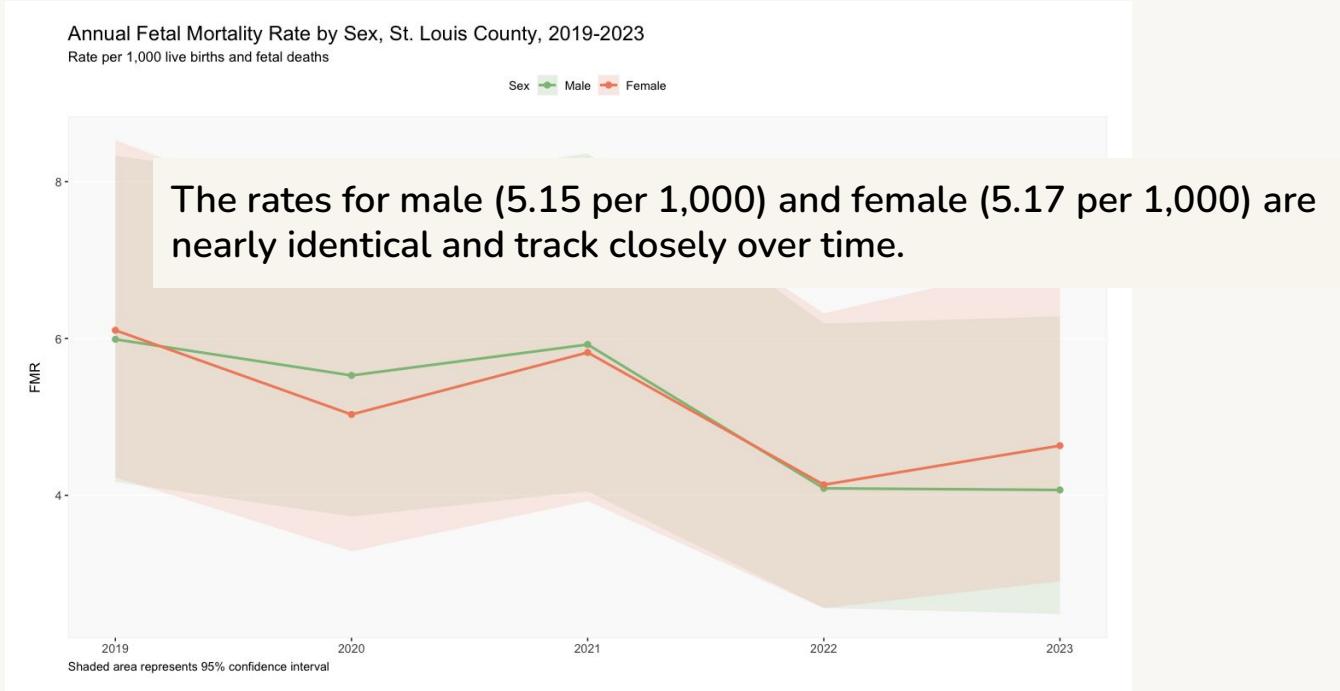

We see elevated rates among the youngest (7.18 per 1,000 for ages 15-19)

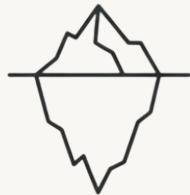

Fetal Mortality Rate by Maternal Age Group, Saint Louis County 2019 to 2023

Age Group	Fetal Deaths	Live Births	Total	Fetal Mortality Rate		95% CI	CI Method
				per 1000 live births and fetal deaths	Lower	Upper	
15-19	12	1,659	1,671	7.18	3.71	12.54	Poisson
20-24	45	7,273	7,318	6.15	4.49	8.23	Poisson
25-29	83	13,605	13,688	6.06	4.82	7.53	Poisson
30-34	78	18,397	18,475	4.22	3.34	5.27	Poisson
35-39	50	9,547	9,597	5.21	3.87	6.87	Poisson
40-44	9	1,789	1,798	5.01	2.29	9.50	Poisson

# Shows No Significant Difference by Fetal Sex

# From Data to Meaning: The Story of Inequity

## 1. Averages Hide Disparities

Our overall progress is positive, but it masks a critical and ongoing crisis for Black families in our community.

## 2. This is a Systemic Issue

A gap this large and persistent is not about individual choices. It points to systemic factors like healthcare access, quality of care, and structural inequities.

## 3. This is a Call to Action

This data is not just information; it is a mandate to act.

# How Can We Write a Different Story?

**Listen & Learn:** How do we center the voices and lived experiences to understand the "why" behind the numbers? to understand their lived experiences and co-design meaningful solutions

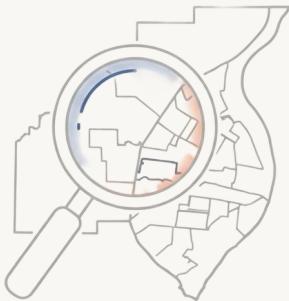

**Strengthen Support:** What community-based programs can we expand to provide culturally competent care? To improve the quality and availability of culturally competent care.

**Demand Equity:** How can we work with healthcare systems ensure equitable, respectful care for every mother? Champion policies that address social determinants of health, such as stable housing, food security, and economic opportunity

# What We Need for a Clearer Picture

**More Granular Data:** Analysis by zip code or neighborhood to identify hotspots of disparities

**Linkage to Social Determinants:** Connecting outcomes to data on housing, income, and education.

**Qualitative Insights:** A formal process for gathering patient experience stories to complement the numbers.

# Every pregnancy should have a healthy outcome.

---

Discussion & Questions

Thank You

2. MacDorman, M. F., & Gregory, E. C. W. (2015, July 23). Fetal and perinatal mortality: United States, 2013 (National Center for Health Statistics. Vital and Health Statistics, 64[8], 1–24). <https://stacks.cdc.gov/view/cdc/231851>

## Fetal Mortality Rate, Saint Louis County 2019 to 2023

$$\text{Fetal mortality rate} = \frac{\text{Fetal deaths at 20 weeks of gestation or more}}{\text{Live births and fetal deaths at 20 weeks or more}} \times 1,000$$

For Normal Distribution (deaths  $\geq 100$ ):

$$\text{Lower: } R_1 - 1.96 * R_1 * \frac{\text{RSE}(R_1)}{100}$$

$$\text{Upper: } R_1 + 1.96 * R_1 * \frac{\text{RSE}(R_1)}{100}$$

$$\text{RSE of the fetal mortality rate: } \text{RSE} = 100 * \sqrt{\frac{1}{D} + \frac{1}{B}}$$

For Poisson Distribution (deaths  $< 100$ ):

$$\text{Lower: } R_1 \cdot L(0.95, D_{\text{adj}})$$

$$\text{Upper: } R_1 \cdot U(0.95, D_{\text{adj}})$$

$$D_{\text{adj}} = \frac{D \bullet B}{D + B}$$

Using the CDC Poisson L/U confidence-limit table for fetal and perinatal mortality rates. Using qchisq in R, same values as the CDC Poisson L/U confidence-limit table

$$L = \frac{\text{qchisq}(0.025, 2n)}{2n}$$

$$U = \frac{\text{qchisq}(0.975, 2(n + 1))}{2n}$$

Fetal Mortality Rate, Saint Louis County, 2019 to 2023
